

Biosolids (sludge) vs. Anhydrous Ammonia Fertilizer-Irrigated Corn/Soybean Rotation Study ID: 096109199301M3

County: Lancaster

OBJECTIVE: To determine and document the effect on profitability and soil fertility of biosolids

versus anhydrous ammonia fertilizer as a nutrient source. Biosolid effects will be

evaluated on a corn and soybean rotation.

BIOSOLIDS ANHYDROUS

Treatment: Treatment:

Load sludge: Spring 1993 None

Spread sludge: Spring 1993-35 tons/acre Fertilize: 1993-Anhydrous Ammonia, 90 pounds

Disc: 1993-incorporate biosolids None

Field cultivate: 1993 Field cultivate: 1993

Plant Plant

Herbicide: 1993-3.5 quarts Bullet Herbicide: 1993-3.5 quarts Bullet

1994-6 ounces Canopy, 2 quarts Lasso MT and 2 pints Command

^{* &#}x27;significantly different at 90% confidence level

^{**} significantly different at 95% confidence level

Biosolids (sludge) vs. Anhydrous Fertilizer-Irrigated Corn/Soybean Rotation, Page 4

Summary:

The corn fertilized with biosolids did not yield significantly higher than the anhydrous fertilized crop (significant @ .11). The biosolid <u>was incorporated</u> in this comparison. It was an unusually wet growing season in 1993 and mineralization of organic nitrogen may have influenced grain moisture at harvest in this field.

Soybeans were grown on this field in 1994 with no additional fertilizer applied to either treatment. There was no significant difference between treatments.

Corn was grown on this field in 1995 with a blanket fertilizer treatment of Ammonium Nitrate applied to the entire field. No significant differences were measured.

Biosolid nitrogen resources are estimated to be 40% available the year of application, 30% the following year, 20% the third year and 10% the fourth year. Biosolids also contain other valuable nutrients including phosphorus, potassium, sulfur and zinc. The anhydrous fertilizer treatment cost approximately \$7.00/acre more than the biosolids treatment in the application year while the biosolids application expenses are amortized over their useful life.

The profitability of using biosolids depends largely on available labor, machine investment and soil characteristics.
